

A product under test is tested remotely. A network accessible site receives input for the product under test from a remote user connected to a network accessible site. The input for the product under test is forwarded to a process that presents the input to the product under test as if the input came from an input device directly connected to the product under test. Display information from the product under test is intercepted. The display information describes a current display generated by the product under test. The intercepted display information is displayed on the network accessible site.
